For

## Java Skills Evaluation

Version 1.0

## USE CASE DESCRIPTION

---

### Use Case 1

Write a program that takes a string as input and reverses the vowels of a String. The input of an algorithm is often a string or an array.

Example:

Input-1: Hello World

Output-1: Hollo Werld

Input-2: information

Output-2: onfirmatoin

#### Description

1. Take console input of a string, in **main ()** method, from user
2. Pass the string to method **reverseVowels()** and write the logic in that method to convert it into reverse of vowels string.
3. Return the string from **reverseVowels()** to **main()** and display the reverse string.
4. Template Code of the same is provided at:

**com.iiht.training.reverse.ReverseVowels**

### Use Case 2

Write a Program to trim a given string where replace the multiple occurrences of blank spaces with single space.

Example:

Input-1: how        are    you    ?

Output-1: how are you ?

Input-2: Hi    All

Output-2: Hi All

#### Description

1. Take console input of a number, in **main ()** method from the user.
2. Pass the String to method **trimWhiteSpaces()** and write the logic in that method to remove the extra white spaces from the beginning, middle or end of the string and store them in a variable.
3. Return the string from **trimWhiteSpaces()** to **main()** and display the string.
4. Template Code of the same is provided at:

**com.iiht.training.trimwhitespaces.TrimWhiteSpaces**

## EXECUTION STEPS

---

1. All actions like build, compile, running application, running test cases will be through Command Terminal.
2. To open the command terminal the test takers, need to go to Application menu (Three horizontal lines at left top) -> Terminal ->New Terminal.
3. This editor Auto Saves the code.
4. If you want to exit(logout) and continue the coding later anytime (using Save & Exit option on Assessment Landing Page) then you need to use CTRL+Shift+B-command compulsorily on code IDE. This will push or save the updated contents in the internal git/repository. Else the code will not be available in the next login.
5. These are time bound assessments the timer would stop if you logout and while logging in back using the same credentials the timer would resume from the same time it was stopped from the previous logout.
6. Command to run code for use-case 1:  

```
mvn compile exec:java -Dexec.mainClass="com.iiht.training.reverse.ReverseVowels"
```
7. Command to run code for use-case 2:  

```
mvn compile exec:java -  
Dexec.mainClass="com.iiht.training.trimwhitespaces.TrimWhiteSpaces"
```
8. You need to use CTRL+Shift+B - command compulsorily on code IDE, before final submission as well. This will push or save the updated contents in the internal git/repository, and will be used to evaluate the code quality.

## CONSIDERATIONS

---

1. **Mandatory:** Run the following command before the final submission

**mvn test**

(You can run this command multiple times to identify the test case status, and refactor code to make maximum test cases passed before final submission)

2. Your code will also be evaluated for code quality, naming conventions, readability etc.
3. **Make sure you do not modify existing class and method names and their signatures, else it would severely affect final result**
4. **Make sure you do not add any new class or methods, else it would severely affect final result**
5. **Make sure you do not modify any test cases, else it would severely affect final result**
